

ABSTRACT

A hand-held device having a display and a browser application which supports functionality particularly suited for the hand-held device. For example, the browser application supports a full screen tag which allows information to be displayed as a full
5 screen within the display. The browser application may also support a tag for use in displaying a link the activation of which will cause the hand-held device to transmit command codes to a consumer appliance. Still further, the browser application can support a tag which the hand-held device can use to issue reminders.
